European Gravity Service for Improved Emergency Management

Objectives

The Grant Preparation with the European Commission in the frame of the Horizon 2020 program has been successfully completed last year and EGSIM has officially started on January 1, 2015.

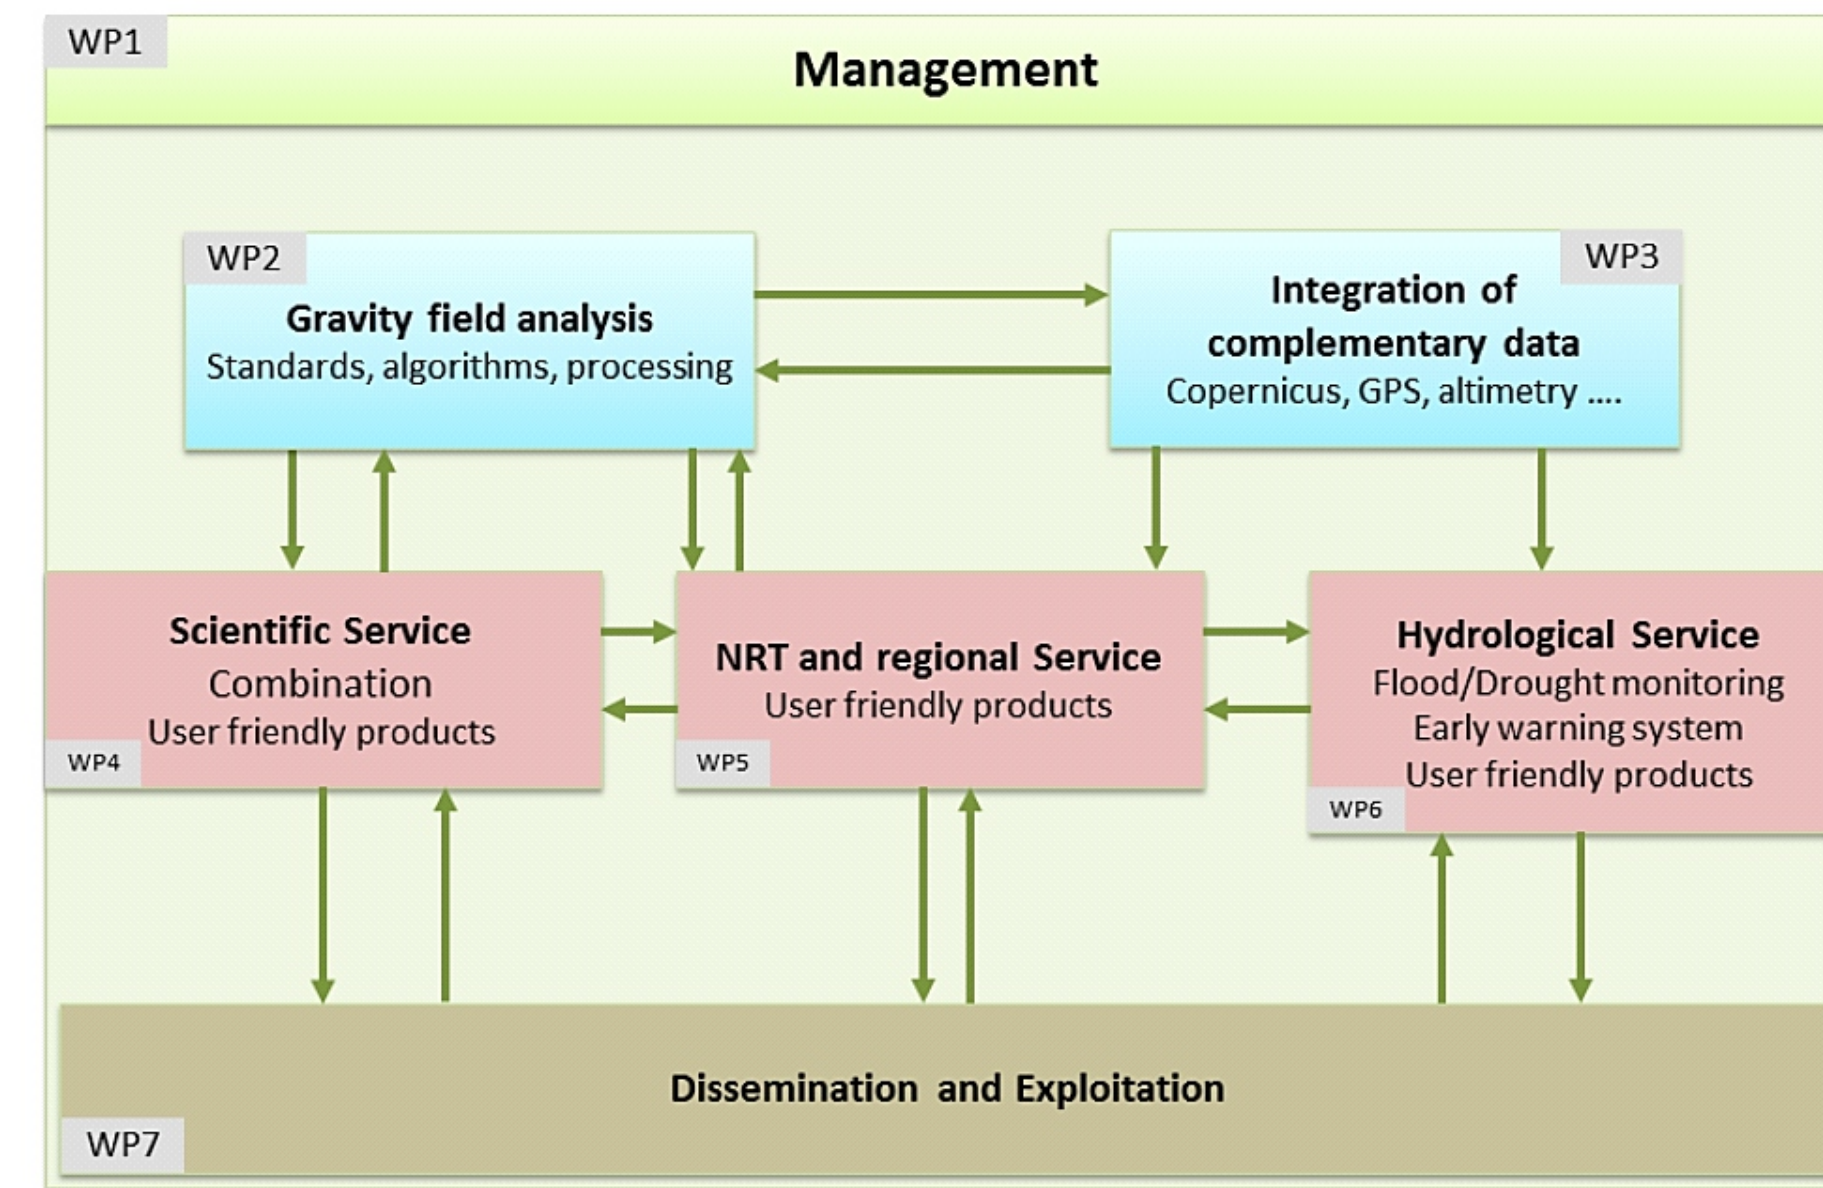

The three main objectives of EGSIM are:

- delivering the **best gravity products** for applications in Earth and environmental science research,
- reducing the latency and increasing the temporal resolution** of the gravity and therefore mass redistribution products,
- developing **gravity-based indicators for extreme hydrological events** and demonstrating their value for flood & drought forecasting and monitoring services.

Project Partners

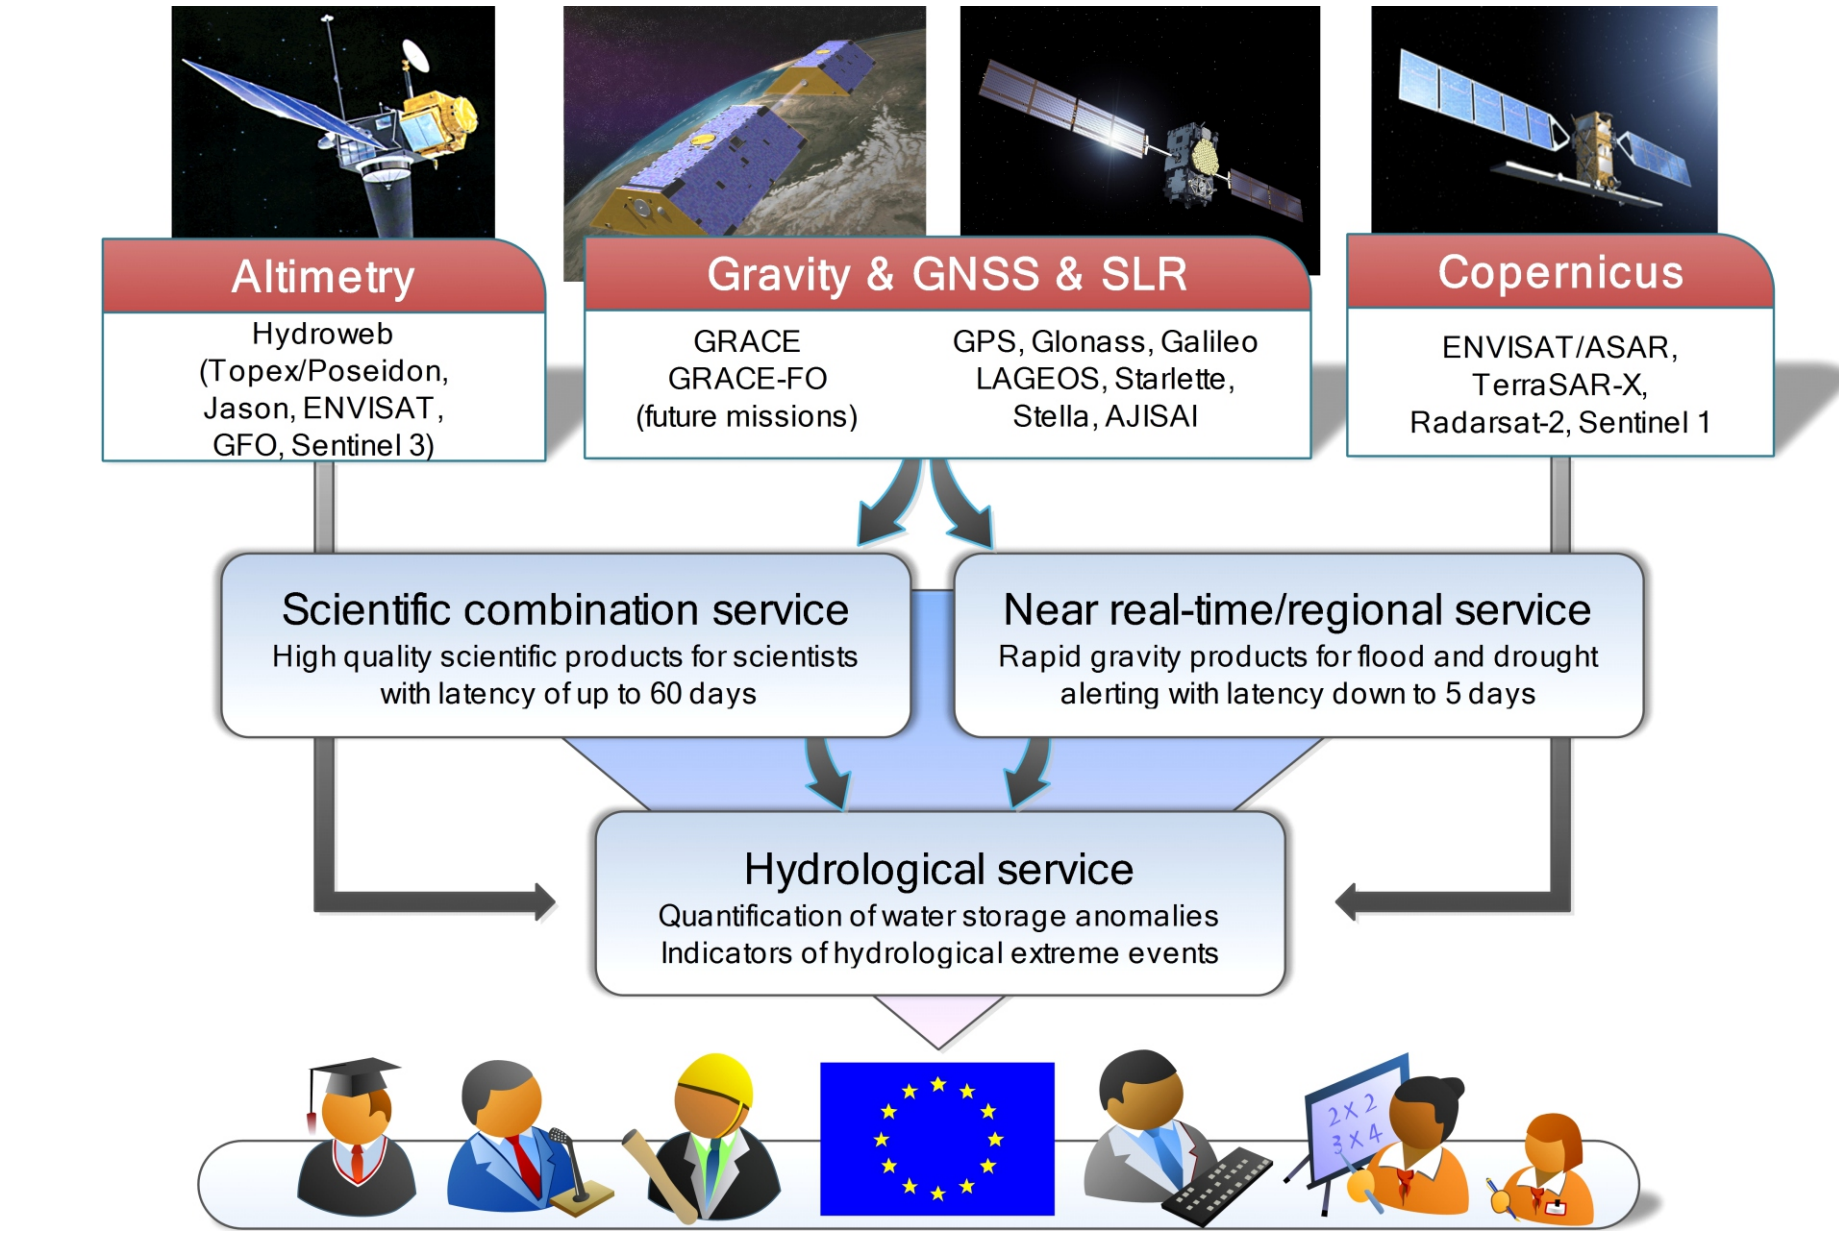

Project Structure

The used input data sources and the anticipated services that shall be established are reflected in the EGSIM WP structure.

Upcoming Services

Services will be tailored to the needs of governments, scientists, decision makers, stakeholders and engineers. Special visualisation tools will be used to inform, update, and attract also the large public.

Scientific Service

In the frame of the project different groups will generate gravity field solutions based on independent processing strategies:

- GFZ** direct approach
- CNES** direct approach
- AIUB** celestial mechanics approach
- ITSG** short-arc approach
- University of Luxembourg** acceleration approach (may be more in future)
- ...

Near Real Time and Regional Service

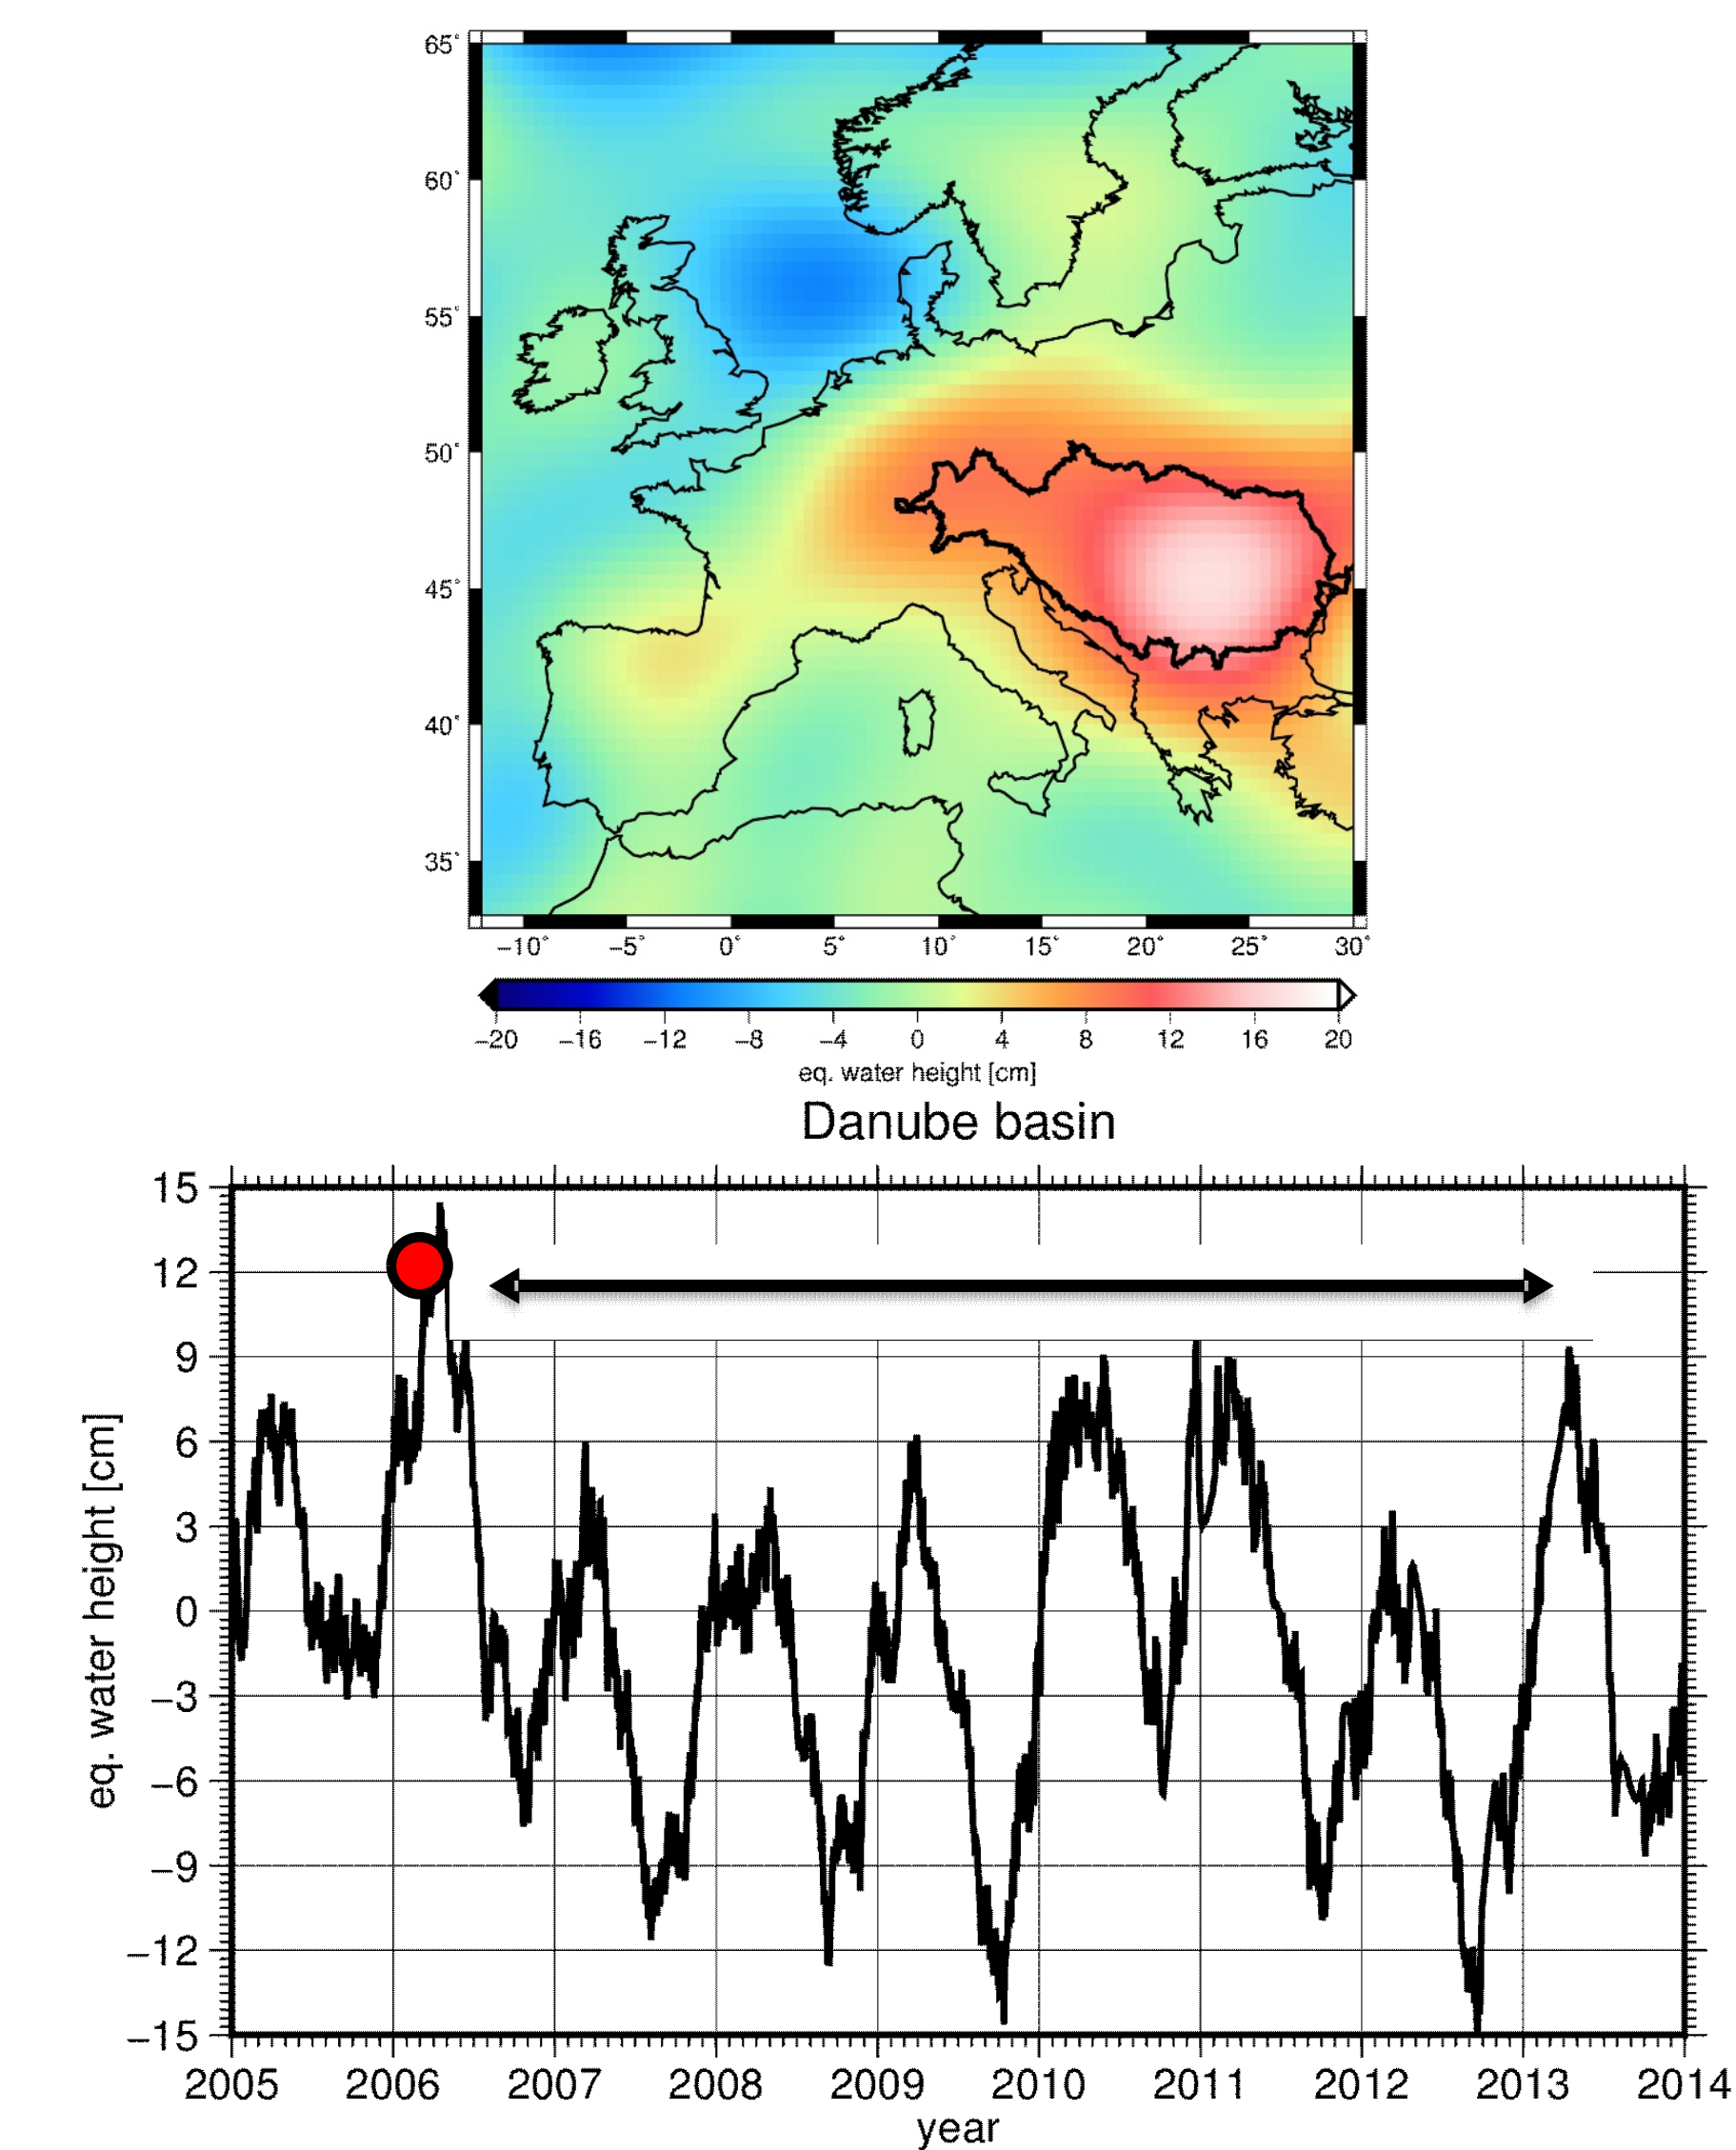

Daily updated solution (Near real-time with max. 5 days delay)

ITSG:

Kalman filtered solutions

GFZ:

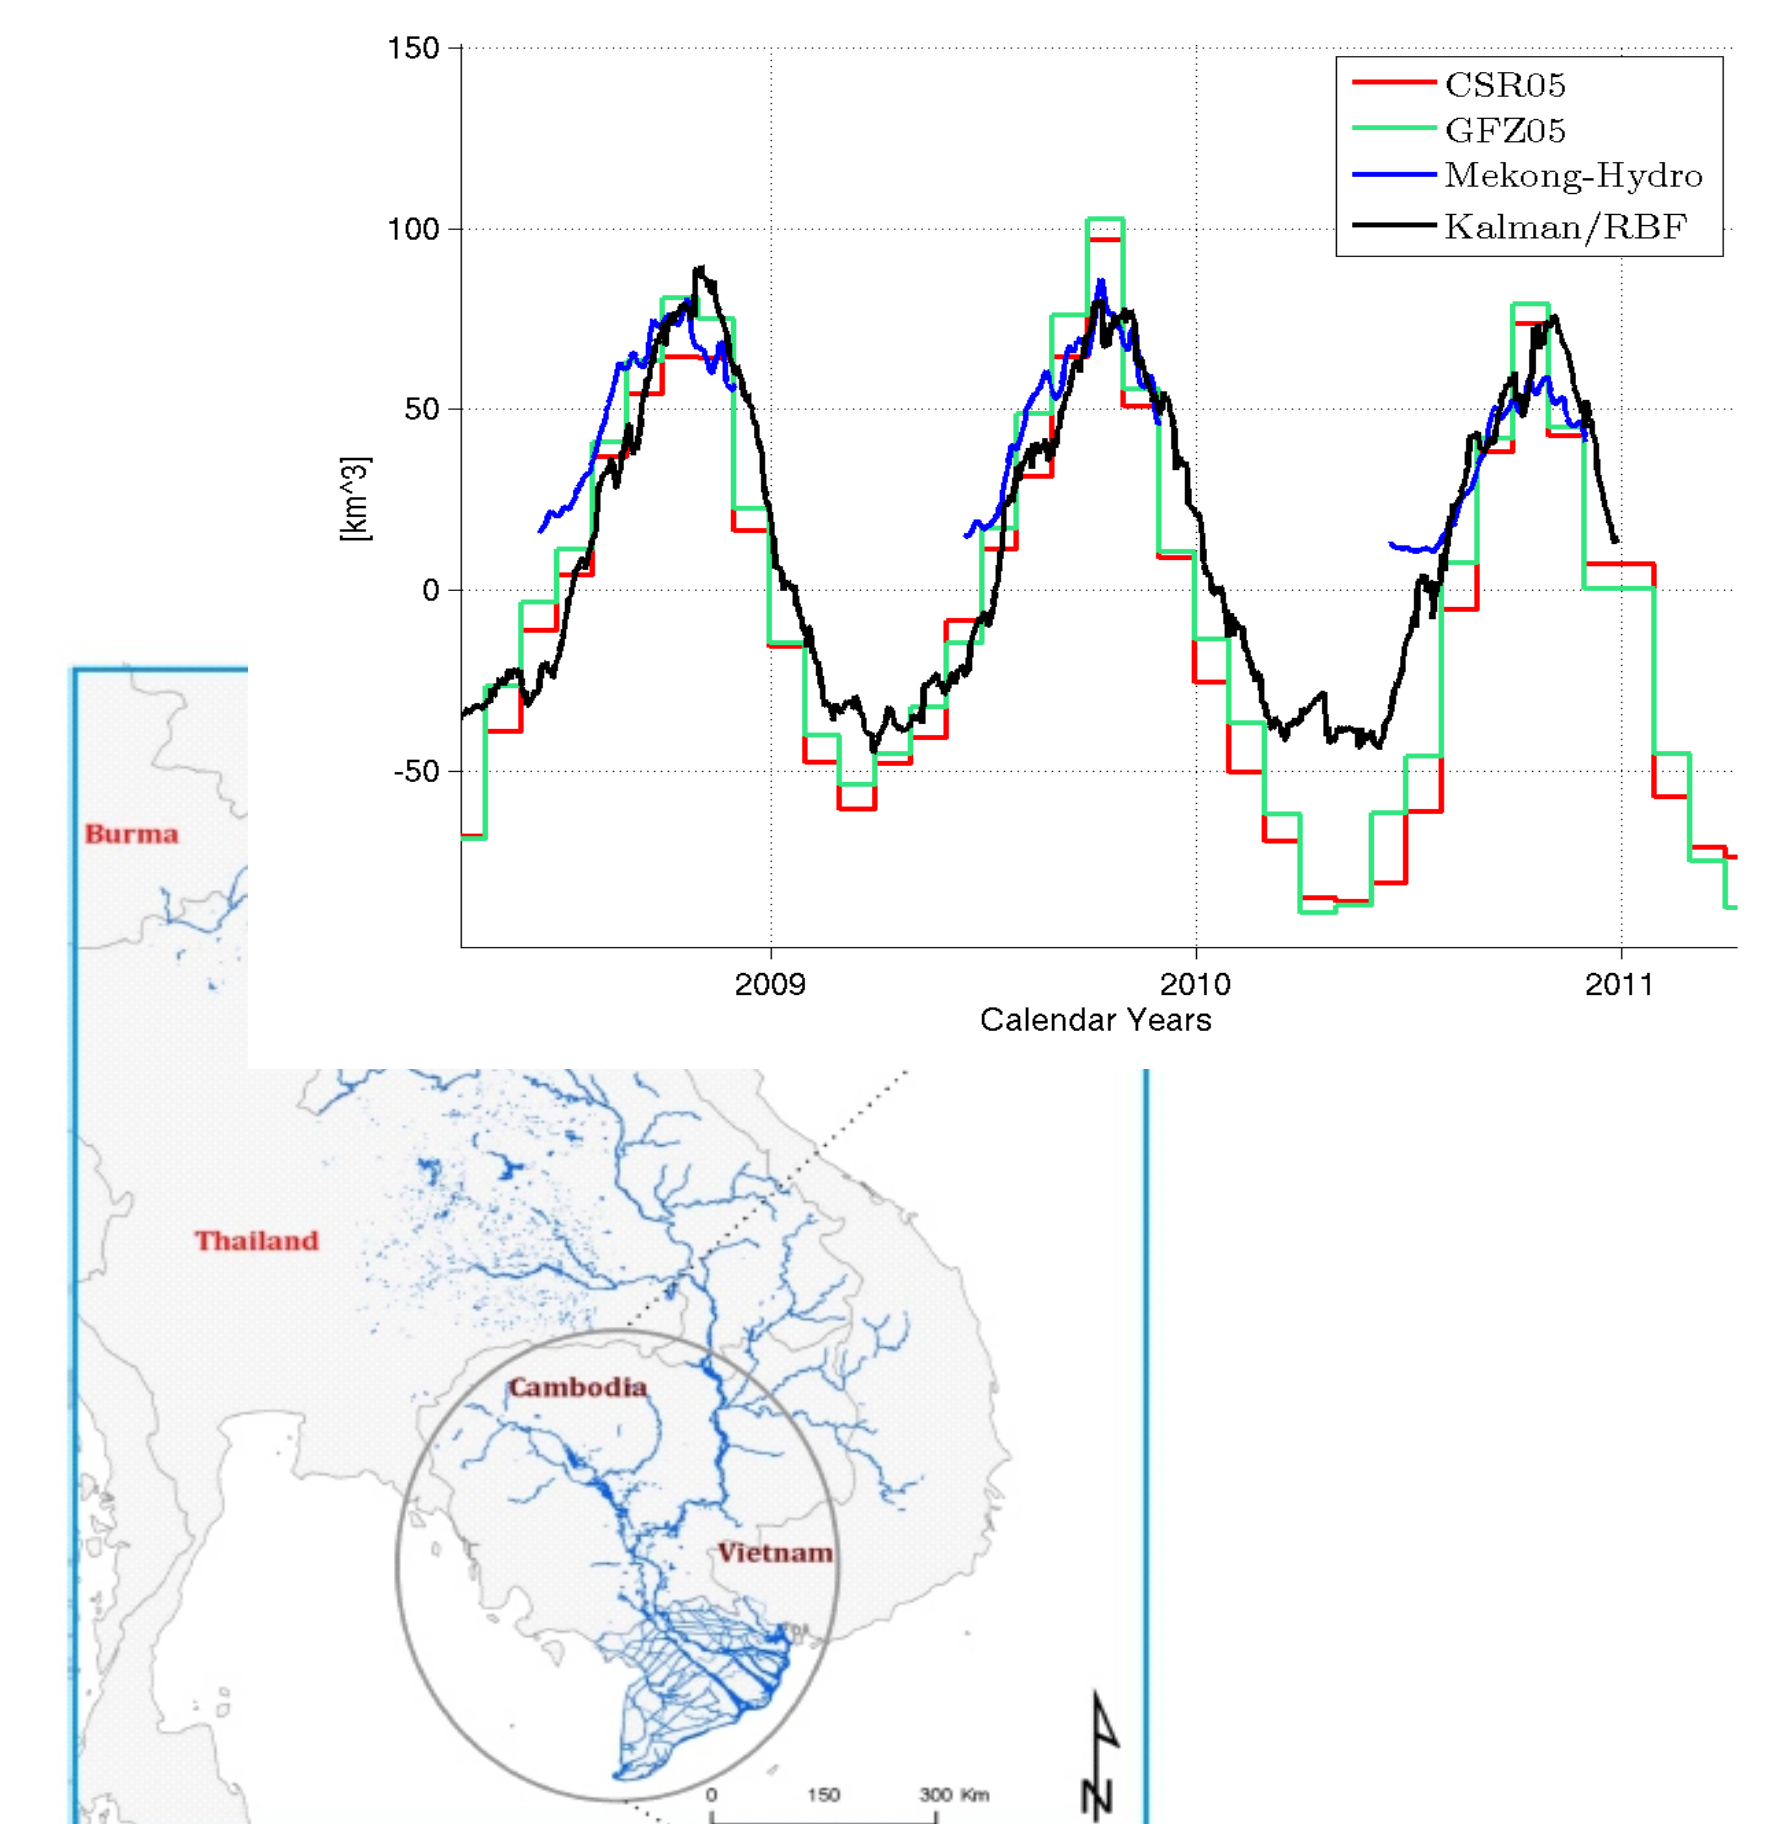

Alternative representations (e.g., radial basis functions)

Hydrological Service

Gravity-based flood and drought indicators as descriptors of the integral wetness status of river basins → early warning for hydrological extreme events.

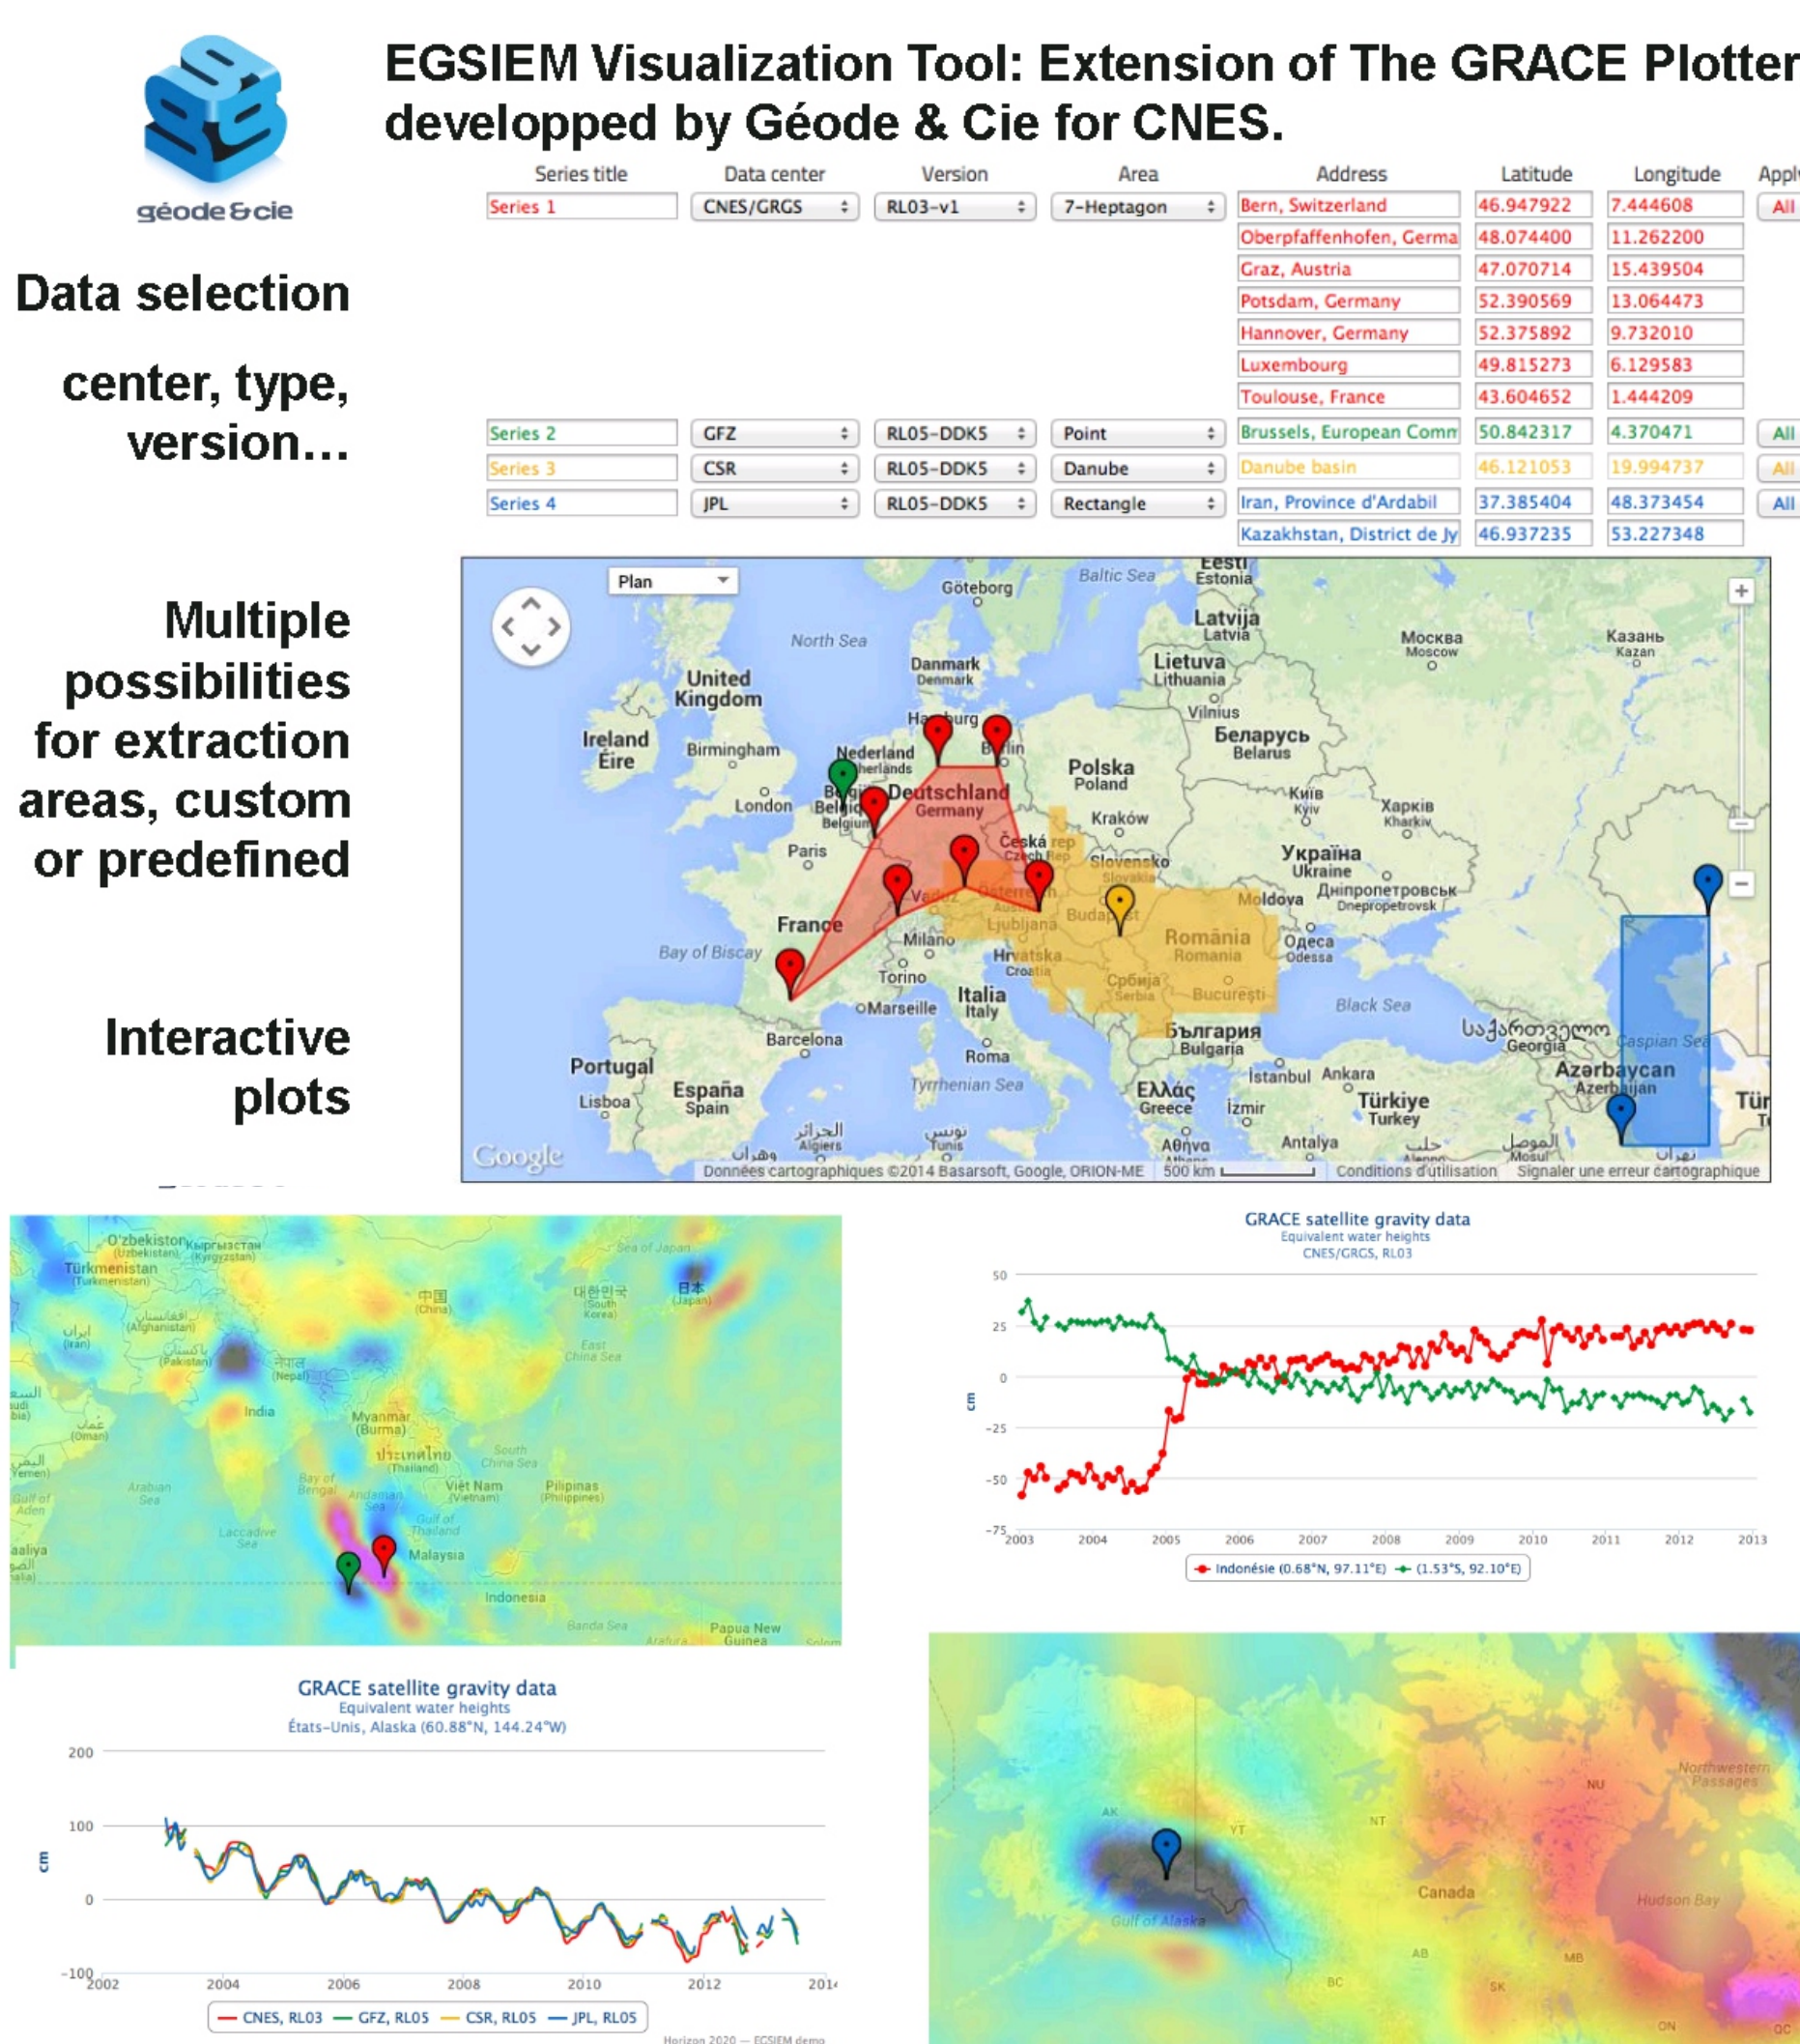

Integration into automatic flood emergency management services. An operational test run of half a year is foreseen in the frame of DLR's Center for Satellite Based Crisis Information.

Dissemination and Exploitation

A central component of the EGSIM dissemination activities will be the EGSIM plotter, which allows easy data access and visualization (examples on the right hand side).

EGSIM will have an open data policy with respect to all data generated within the project. Accessibility to all levels will be guaranteed via the project website: <http://www.egsim.eu>

Status of the Project

- The EGSIM project started on January 1st, 2015.
- EGSIM will run for three years (2015-2017).
- Future integration into the services of the International Association of Geodesy (IAG), e.g., under the umbrella of the International Gravity Field Service (IGFS), and into the Copernicus emergency service is envisaged.
- EGSIM will have an open data policy and is open for collaborations with further partners.
- Collaborations/associating projects with other partners are very welcome. Service Level Agreements can be signed anytime during project duration.

In collaboration with and supported by

Acknowledgement

This project has received funding from the European Union's Horizon 2020 research and innovation program under the grant agreement No. 637010.
